

Project Executable Files

Date	04 July 2026
Team ID	xxxxxx
Project Name	AI Powered Debt Relief & Financial Recovery Platform
Maximum Marks	3 Marks

Project Executable Files

This section requires submission of all executable and deployable files for your project. Ensure all files are properly organized, named, and uploaded to the specified submission platform. The evaluator must be able to run or deploy your solution using the provided files and instructions.

Step 1: Submission Checklist

S.No	Item to Submit	Submitted (Yes / No / NA)
1	Complete source code (all files and folders)	Yes
2	README / Setup Guide (instructions to run the project)	Yes
3	requirements.txt / package.json / dependency file	Yes
4	Database schema / seed files (if applicable)	Yes
5	Environment configuration file (.env.example or similar)	Yes
6	Deployed application URL (if hosted)	Yes
7	APK / Executable binary (if applicable for mobile/desktop apps)	NA
8	Dockerfile / Containerization config (if applicable)	No
9	Test files and test results	Yes
10	Demo video or walkthrough (if required)	Yes

Step 2: File / Folder Structure

Provide an overview of your project's file and folder structure below:

Step 3: Deployment / Access Details

Field	Details
Hosted / Deployed URL	http://localhost:5173
Login Credentials (Demo)	Use the actual email and password stored in your database (don't invent demo credentials).
Platform / Hosting Provider	Local Development Environment (Frontend: Vite, Backend: Uvicorn/FastAPI, Database: SQLite)
Repository Link	https://github.com/Sabiha12-code/AI-Powered-Debt-Relief-and-Financial-Recovery-Platform.git
Demo Video Link	https://drive.google.com/drive/folders/1x3o3c9ON8vJDolnSNkTDwnbfIss3qvSB?usp=sharing

Step 4: Run Instructions

Provide clear, step-by-step instructions for the evaluator to run your project locally:

Pre-requisites

- Python 3.10 or higher
- Node.js v18 or higher with npm
- Google Gemini API Key

Execution Steps

1 Step 1: Clone the Repository

```
Bash
git clone <your-github-repository-url>
cd finrelief-ai
```

2 Step 2: Set Up the Backend

```
Bash
cd backend
python -m venv venv
# Windows
venv\Scripts\activate
# Install dependencies
pip install -r requirements.txt
```

Note: If your requirements.txt is located elsewhere, use the correct path (e.g., `pip install -r ../requirements.txt`).

3 Step 3: Configure Environment Variables

Create a .env file in the location expected by the backend:

```
.env
GEMINI_API_KEY=your_gemini_api_key
SECRET_KEY=your_secret_key
```

4 Step 4 (correction): Start the Backend

```
Bash
python -m uvicorn backend.app.main:app --reload
```

 (Use the exact command configured in your project if it differs.)

5 Step 5: Start the Frontend

```
Bash
cd frontend
npm install
npm run dev
```

6 Step 6: Access the Application

Open your browser and visit:

 <http://localhost:5173>

Step 5: Known Issues / Limitations

S.No	Known Issue / Limitation	Workaround / Status
1	The application is not publicly deployed and currently runs only in a local development environment .	Run the frontend and backend locally using Vite and FastAPI .
2	AI-powered features require a valid Google Gemini API Key and an active internet connection.	Configure the API key in the .env file before running the application.
3	The project uses SQLite as the database, which is suitable for development and demonstration but not recommended for large-scale production environments	A production database such as PostgreSQL or MySQL can be used in future deployments.
